G-Cloud suppliers Novo Systems Ltd and Forfront join forces to deliver critical solution for **The International Centre for ENC**s, part of the United Kingdom Hydrographic Office, a division of the Ministry of Defence

Forfront has once again been confirmed as an approved supplier for Software As A Service (SaaS) and Specialist Cloud Services (SCS) on the UK Government G-Cloud 8 (G8). In addition to this, Forfront is delighted to announce that they have been selected by Novo Systems (also a supplier on G-Cloud) as a software development partner for one of their forthcoming key projects, a modern bespoke software solution to replace a legacy system that forms a vital part of their compliance operations.

Lee Greenlee of Novo Systems commented "Forfront were chosen following a thorough selection process, what stood out was their proven track record, their professionalism and demonstrable approach including a proposed solution fit for purpose, which is also on course to be delivered in a short time frame..."

Forfront's skilled in-house technical team includes developers, software designers, database architects, project managers, business analysts, test analysts, graphic designers and IT engineers. However, it is their dedication to building long term relationships where they become trusted partners which is fast distinguishing the company as the software house with the human touch and attention to detail. Technical Director Richard Beacroft stated "This sort of project falls right in our sweet spot, interpreting complex requirements, learning the intricacies of our customer's needs and providing a bespoke solution is most certainly the way we work the best. We are really excited to have been selected to deliver this project and look forward to working with Novo Systems on this and hopefully many more future projects."

Since 1998 Forfront have partnered with businesses to develop the software they need, specialising in designing, writing, hosting and maintaining software solutions including: Software as a Service (SaaS); online applications; websites; ecommerce projects and Application Service Provision (ASP).
